

Project Documentation

1. Project Description

This project is a Weather Application developed in C# using the ASP.NET Core framework. The application exposes an API endpoint to retrieve weather data. Its primary purpose is to demonstrate a simple yet functional web API that can be extended or integrated with external weather services.

The structure includes:

- Controllers/WeatherController.cs: Handles incoming HTTP requests.
- Services/WeatherServices.cs: Contains the business logic related to weather data.
- Configuration files (appsettings.json, etc.) for environment-specific settings.

2. Technologies Used

- C#
- ASP.NET Core
- .NET SDK
- Entity Framework (if database is added in future)
- REST API design
- Standard .NET project structure with solution file (weatherapp.sln)

3. Instructions for Running

Prerequisites:

- .NET SDK installed (e.g., .NET 6 or later)
- IDE or text editor (e.g., Visual Studio, Visual Studio Code)

Steps:

1. Clone or extract the project to your local machine.
2. Open a terminal and navigate to the project folder:
`cd WeatherAPP`
3. Restore dependencies (if needed):
`dotnet restore`
4. Build the project:
`dotnet build`
5. Run the project:
`dotnet run`
6. The API should now be available locally (e.g., <https://localhost:5001> or similar).
